

**POST-DOC POSITION IN CELL AND DEVELOPMENTAL BIOLOGY.  
INSTITUTE OF BIOLOGY VALROSE, NICE, FRANCE**

---

Position available (starting early 2016) in Pascal Théron laboratory to functionally characterize Hedgehog secretion and spreading in *Drosophila*. Hedgehog proteins are key signaling mediators that govern a wide range of processes during embryonic development and adult tissue homeostasis from *Drosophila* to human. Hedgehogs are the only metazoan proteins known to possess a covalently-linked cholesterol moiety. Our laboratory is interested in how Hedgehog proteins traffic in the producing tissue and exert their function in the receiving tissue.

We have recently shown that the Endosomal Sorting Complex Required for Transport (ESCRT) promotes Hedgehog proteins loading on exo-vesicles to exert their effect at long distances. The post-doctoral project aims to gain further insight into the trafficking, vesicular secretion and the extracellular spread of Hedgehog proteins through tissues using cell biology and genetic technics. Moreover, *in vivo* imaging and single molecule tracking (in collaboration with computational science lab) will be developed to investigate the dynamics of Hedgehog release and spreading.

Interested candidates should have strong knowledge of, and experience in fly genetics, cell biology and optic microscopy (confocal/spinning disc). The position is funded for 2-3 years in duration. Candidates must have a Ph.D. degree, and can be nationals of any country.
